

# Moving around

You can use the arrow keys – or other keys like a, d, w, s – to move around an asset.

In this example we are focusing on the movements and we use an asterisk instead of an asset.

Create a `main.lua` file that:

- Create a star table containing the x and y coordinates, the movement speed and the character to be shown.
- Create an `update(dt)` function, that changes the x and y coordinates depending on the key being pressed.
- in `draw()`, draw the star character at the x and y coordinates.

The `dt` argument in `update(dt)`, contains the time elapsed since the last time `update()` has been called: by multiplying the speed by `dt`, we make sure that the star is moving as the same speed on new and old computers.
